**Lab: GROWTH HORMONE (GH)**

**Date: 2013-11-08**

Name	Value	Reference Range
GROWTH HORMONE (GH)	0.1	< OR = 10.0 ng/mL

Because of a pulsatile secretion pattern, random (unstimulated) growth hormone (GH) levels are frequently undetectable in normal children and adults and are not reliable for diagnosing GH deficiency. Regarding suppression tests, failure to suppress GH is diagnostic of acromegaly.

Typical GH response in healthy subjects:  
 Using the glucose tolerance (GH suppression) test, acromegaly is ruled out if the patient's GH level is <0.4 ng/mL at any point in the timed sequence.

Patient: Ortega, Leopoldo DOB: 08/23/1974

Using GH stimulation testing, the following result at any point in the timed sequence makes GH deficiency unlikely:

Adults (> or = 20 years):  
Insulin Hypoglycemia > or = 5.1 ng/mL  
Arginine/GHRH > or = 4.1 ng/mL  
Children (< 20 years):  
All Stimulation Tests > or = 10.0 ng/mL
